

Sprint 3 Report

Nodegent · May 12, 2026
Sprint Period: May 5 – May 12, 2026

Actions to Stop Doing

Stop deferring end-to-end testing until a feature is “fully” complete. Several AI chat edge cases (US-3.1) were only discovered late in the sprint during manual review. Running lightweight smoke tests as features are merged would surface issues earlier and reduce the late-sprint debugging load.

Actions to Start Doing

Start creating brief written summaries of each API integration decision as it is made. The team found itself re-explaining Canvas API quirks and Convex mutation patterns during review sessions in Sprint 3. A living “integration notes” document shared in the repo would eliminate repeated context-switching and onboard team members faster.

Start scheduling one dedicated design-review session per sprint specifically for the AI assistant’s response quality. As Sprint 4 focuses on polish and guardrails, intentional review of AI output accuracy and tone will be more efficient than ad-hoc feedback during standups.

Actions to Keep Doing

Keep the three-times-a-week sync meetings. As in Sprint 2, these brief check-ins continued to surface blockers early — particularly important in Sprint 3 where AI, calendar, and notifications work ran in parallel. The format scales well and should continue into Sprint 4.

Keep the practice of locking down API contracts and data shapes at the start of each sprint. This discipline, adopted after Sprint 2 retro, visibly reduced throwaway rework in Sprint 3 and should be maintained through the final sprint.

Work Completed / Not Completed

Completed

ID	User Story	Pts
US-3.1	Campus-aware AI chat assistant with access to student’s course/assignment data	5
US-3.2	Google Calendar sync — deadlines and class schedule pushed to student’s calendar	5

ID	User Story	Pts
US-3.3	New assignment notifications when Canvas data is refreshed	3
US-3.4	Access toggle controls to enable/disable LMS, SIS, and calendar integrations	3

Not Completed

ID	User Story	Pts
—	None — all Sprint 3 stories completed	—

Work Completion Rate

Metric	Value
Total user stories completed	4
Total story points completed	16 / 16
Total estimated ideal work hours	~14 hrs
Total sprint days	4
User stories / day	4.0
Ideal work hours / day	3.5
Avg. user stories / day (Sprints 2–3)	4.1
Avg. ideal work hours / day (Sprints 2–3)	3.0
